

Swine Flu Influenza Type A/H1N1 Protection

By Gordon Pedersen Ph.D.

H1N1 is a serious threat to our health and way of life. The best way to treat it influenza is to prevent it and employ healthy hygiene. Drugs have serious side effects and cannot be used by the entire population and should not be used for long periods of time.

In order to control an epidemic all types of treatment should be employed including prescription drugs (ACE, ARB's, TNF-alpha blockers, anti-viral and anti-bacterial) vitamins, mineral, antioxidant herbs, proper hygiene, air filtration, water filtration and the proper use of diet and nutritional supplements, especially the newly patented, FDA approved Silver Sol technology. Silver Sol destroys bacteria, viruses, and mold so it demonstrates broader spectrum of activity than any antibiotic or antiviral drug. It can be taken daily due to the fact that it passes through the body unchanged, and can prevent viral infections, treat them and work synergistically with antibiotics to produce as much as a ten fold increase in activity against the bacteria that cause death in influenza

Influenza viruses are the respiratory viruses of greatest public health importance, particularly Influenza A. Every year 36,000 people die from Influenza making it the 6th leading cause of death in America. Approximately 1 in every 1,000 swine flu patients dies from the infection. This is close to the same rate we have been seeing the past few years but antigenic drift and antigenic shift may create a new and fatal form of Influenza that humans have no immunity against. The World Health Organization declared the H1N1 Swine Flu a pandemic in June of 2009.

Silver Sol:

Prescription drugs and vaccines treat and help prevent viral infection and disease but are not capable of totally controlling a dangerous new or novel virus. Nutritional supplements such as Vitamins, Minerals, Echinacea, Ginseng, Probiotics and many others have the ability to help boost immune function and improve natural defenses which results in some defense against disease causing viruses and the associated secondary infections

Sniper, with Silver Sol provides proven prevention and treatment against viral and bacterial infections, while there is nothing else with such broad spectrum benefits. In

addition, Silver Sol can be safely taken every day for prevention where it has been shown to provide protection against the very dangerous Bird flu H5N1. The combination of antibiotics with Silver Sol has been shown to enhance antibiotic function by as much as ten fold due to the fact that Silver Sol kills the residual pathogens that the antibiotics cannot. Results of the combination of 19 different prescription antibiotics and Silver Sol demonstrate safe additive and/or synergistic benefits across 7 different pathogenic strains (Staphylococcus, MRSA, E coli, Pseudomonas arugenosa, Salmonella and Streptococcus). The results of this combination therapy result in significant pathogenic destruction while helping to reduce bacterial resistance. This can be attributed to the fact that Silver Sol does not produce resistance, nor does it destroy the beneficial intestinal probiotic bacteria.

Discussion:

It's worth noting that three fourths of the people who have died from H1N1 influenza have succumbed to a secondary bacterial infection in the lungs and no antiviral drug will treat this condition.

Further, it's evident that the newly patented EPA certified and FDA approved Silver Sol technology provides tremendous treatment options for prevention and combination therapies. Sniper gel, with the Silver Sol technology can help stop viral spread on the most contagious areas like hands, nose, mouth and skin. It is sufficiently documented and proven to be considered a first line of defense against Influenza and a significant companion to antiviral and antibacterial drug regimens topically and orally.
